

A local elementary school has upgraded to a VoIP phone system and needs to ensure they have the ability to provide general announcements, live paging, and emergency notifications to students throughout the campus.

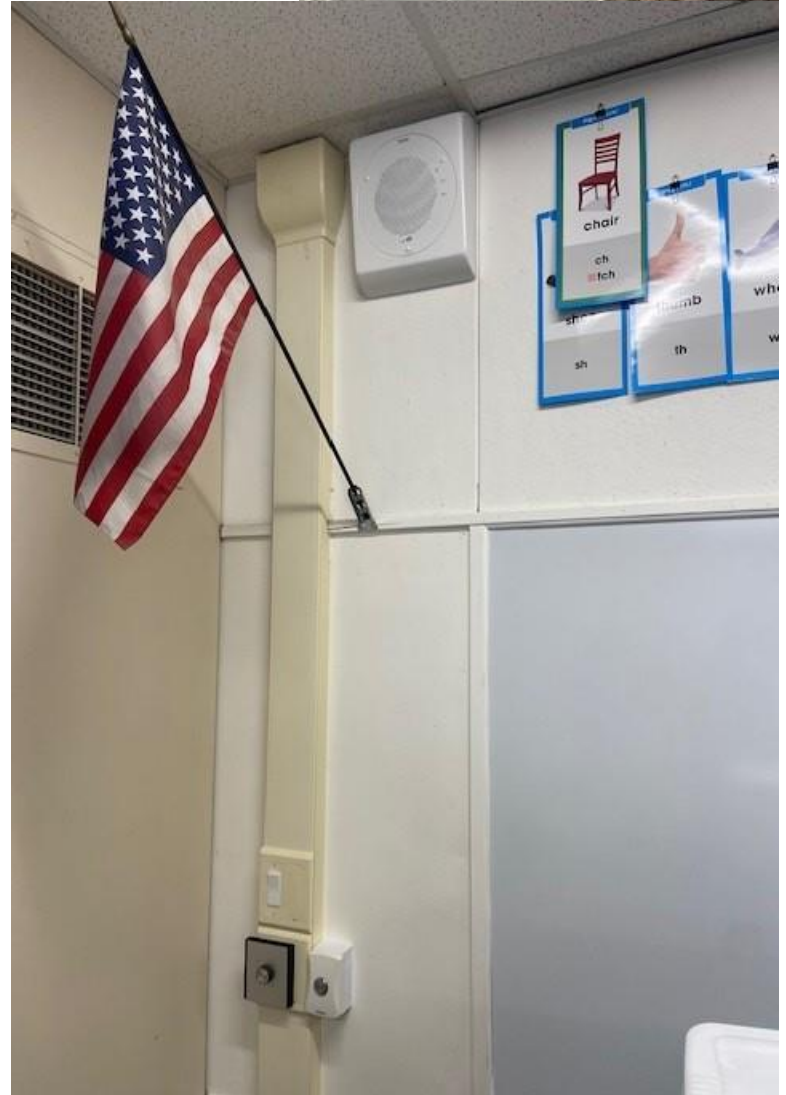

CyberData's Certified Reseller, Potter's Electronics, met with the school to understand their needs and environment. After a walk-through and review of floor plans, Potter's Scope of Work was provided and a multi-purpose notification solution was offered:

- one-way speakers for hallways and talk-back speakers for classrooms
- IP66 Indoor/Outdoor Horns for loud or outdoor environments
- A SIP Paging Server with Bell Scheduler was added to enable zone paging and scheduled announcements and bells, and allows for potential additions such as ADA-compliant strobes and/or secure access intercoms.

This installation was planned for the summer months, with students out on vacation. Students will begin the upcoming school year in an environment with a newly-installed notification system, ensuring general and safety announcements and emergency notifications are heard throughout the school.

As more schools move to update their phone system, they also have the opportunity to augment or update their paging system.

CyberData has options based on budget, environment, and requirement, and a team of certified partners ready to help guide organizations towards the best solution for their needs.
